
HRMS Data Flow Documentation

Employee ID • Payroll • Recruitment • HR Request Workflow

System Architecture & Process Flow Reference

1. Employee ID → HRMS Modules

Once an Employee ID is generated, it becomes the key that links all core HRMS modules. Attendance, Leave, and Task data are captured independently, then consolidated to produce the Payroll output.

Trigger / Origin Process / Module Data Store Consolidation / Output

2. Payroll Flow

Payroll combines information from Attendance, Leave, and Salary Structure at month-end, applies deductions, and routes the result through HR/Finance review before final disbursement.

3. Recruitment Management

Tracks a candidate's journey from application through screening, interview, and evaluation, ending either in rejection or conversion into a full employee record.

4. Employee HR Request Workflow

Covers how an employee-initiated request (leave, attendance regularization, expense, or other HR request) is logged, reviewed, and resolved.

5. Task Management Workflow

Covers the full lifecycle of a task: creation and assignment by Admin/Manager, execution by the Employee, and final review/approval before closure.

6. Attendance Capture Workflow

Traces how a raw punch event from a biometric/kiosk device is validated, classified as On Time or Late, and rolled up into working hours and overtime figures that feed into Payroll.
